Egg Surveillance System

"PREVENTION WHEN IT MATTERS MOST"

Presentation By:

Roberto Taormina

Company Overview

- Innovating the Egg Industry by making it safer and more efficient day to day.
- Specialize in advance camera and vision technologies.
- Our team has produced solutions to increase productivity and limit downtime.
- **Stop worrying about objects that may cause major damage to your egg grader.**
- Rota Technologies offers complete solutions for remotely monitoring foreign object detection and prevention.
- Rota Technologies Engineers have over 25 years combined experience in the poultry industry.

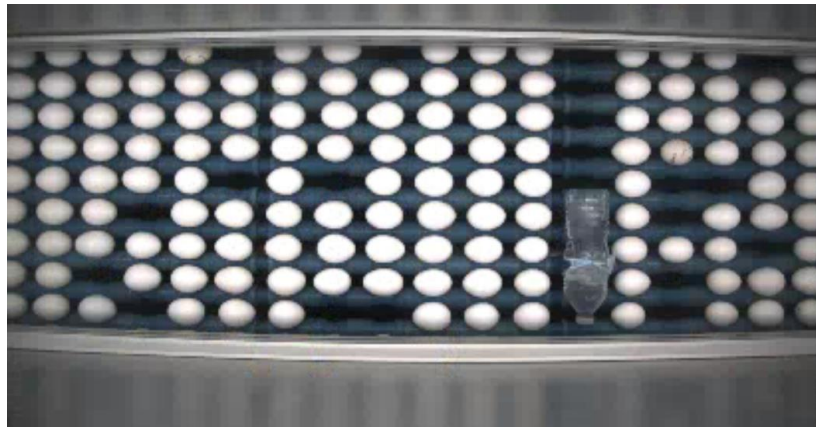

Egg Surveillance System

- The Egg Surveillance System (ESS) will automatically detect foreign objects and debris on the egg conveyor belt in a poultry egg processing plant.
- Our ESS will be placed over any style conveyor belt before the egg washing machine and/or over the egg grading machine.
- As eggs move down the conveyor belt or egg grading machine the ESS inspects the belt for objects other than eggs. These items may include; tools, conveyor parts, light bulbs, bottles, cage system parts, chicken body parts, manure and other miscellaneous items that do not belong on the conveyor belt.
- The unit prevents foreign material from going into the egg washing machines wash water.

Images Of Captured Debris

Don't let this happen to you!

Put simply, people are easily distracted and are not as focused on the job all the time. Watching eggs move down a conveyor belt for hours is a tedious job. The human eye will miss objects when distracted by other job responsibilities or not being completely focused on the egg conveyor belt.
